Lab 5 Self Reflection
10/14/2026

This lab showed me how easy it is to confuse visible examples with widespread adoption. Robotic concrete printing has real construction examples, but that does not tell me how many builders use it. The agent was more credible when it admitted that the evidence could not support an adoption rate.

I found the contrast cases useful because the same evidence led to different timing implications. An innovator could investigate sooner, while a conservative practice wanted comparable completed projects. I want to keep the agent concise without removing the explanation of what is unknown. I wonder how we can gather better local evidence without turning every analysis into a large research project.
