I decided to upgrade from GTP-6 Sol Light mode to GPT-6 Astra in Ultra mode for creating the system instructions using the assigned readings and chapters. After building the prompt and running it through a normal chat session, I found the findings to be much more aligned with concepts discussed in the textbook, especially noting things like Rogers Curve and the 16% adoption rate rule.

I am very excited to share these agent instructions with my team, I think this is the best one I've created so far. For my contrast cases, I held everything constant from the primary except for the adoption posture. I noticed that the agent stayed within the bounds of its duty as a diffusion agent, even when changing the posture from conservative to innovator, specifically:

> *“The hypothetical practice's stated innovator posture makes learning under uncertainty more compatible with its management preference than it would be for a conservative adopter, but that posture does not change the underlying diffusion evidence.”*

This made sense because even though the posture changed, it shouldn’t force us to adopt, we are only gathering evidence around diffusion. I think if we build all of our expert agents this way, we would have an awesome product.
